## DecPro Hardware and Software Update

July 2020

GTI-TSB-093-0720-GB

**Distribution Regions:** All Regions

**Product Relevance:** DecPro

**For use by:** Consultants, Distributors, Contractors and End Users.

### Hardware

Due to the lack of availability of some components used in DecPro versions 1 and 2 (BM), we have had to introduce a new hardware version with immediate effect.

Version 3 (WM) is now a wired version using a USB to serial port cable to communicate with the DecPro software instead of a Bluetooth device. We understand some users will see this as a backwards step, but this has been unavoidable.

There are improvements to this model which will now programme decoders up to 40% faster and increase battery life by up to 25%

Users with V1 and V2 hardware can also benefit from these improvements by returning their hardware to Bailoy for a firmware update. Contact us for the current costs.

### Software

We have also released a new version of DecPro software V2.00. This is partly to cater for the revised hardware but also in preparation for our new generation decoders which are being released in July 2020.

Older versions of DecPro software will not be compatible with the new V3 hardware so if you have a mixture of hardware versions, you will need to install V2.00 software which is backwards compatible with V1 and V2 hardware

This is a free issue software and can be obtained by requesting a download link or a USB software card. There is no unlock required, so the download or USB card can be used to install the software on multiple devices.
